

10-Point Business IT Health Check

A free self-assessment for small businesses · www.deadoralivetechnology.com

Tick each item you're confident about. Any you can't tick with certainty is worth a closer look — that's exactly what our free health check is for. No cost, no obligation.

- 1 Backups that actually work**
Are your backups running, off-site or immutable, and — crucially — have they been test-restored recently?
- 2 Updates & supported software**
Is every device patched, with nothing still running an out-of-support operating system?
- 3 Endpoint protection**
Is antivirus / endpoint security active on every machine, up to date, and actually monitored?
- 4 Passwords & MFA**
Strong, unique passwords, a password manager, and multi-factor authentication on email and key accounts?
- 5 Email security**
Spam and phishing filtering in place, and SPF, DKIM and DMARC set up so your email is trusted?
- 6 Network & firewall**
A secured router with no default passwords, a separate guest Wi-Fi, and remote access locked down.
- 7 User accounts & access**
Least-privilege access, admin rights controlled, and ex-staff accounts promptly removed.
- 8 Data protection & GDPR**
You know where personal data lives, it's protected, and there's a plan if it's ever breached.
- 9 Hardware age & reliability**
Nothing critical is past its sensible replacement age, and single points of failure are identified.
- 10 Disaster recovery plan**
You could recover from ransomware, theft or a fire — and you know roughly how long it would take.

Want us to run the check for you? It's free.
